Right and Left Factorization

In some cases an easier approach to finding a minimal realization is through a factorization of the rational transfer matrix G(s) as a "ratio" of polynomial matrices representing the "numerator" and "denominator."

Any $r \times m$ rational matrix transfer function G(s) can be written as follows:

$$\begin{array}{lll} \underbrace{ \mathcal{G}(s) }_{r \times m} &=& \underbrace{ \mathcal{N}_R(s) }_{r \times m} \underbrace{ \mathcal{D}_R^{-1}(s) }_{m \times m} & (\mathrm{right \ MFD}) \\ &=& \underbrace{ \mathcal{D}_L^{-1}(s) }_{r \times r} \underbrace{ \mathcal{N}_L(s) }_{r \times m} & (\mathrm{left \ MFD}) \end{array}$$

where $N_R(s)$, $D_R(s)$, $N_L(s)$, $D_L(s)$ are polynomial matrices.

$$G(s) = \begin{bmatrix} \frac{n_{11}(s)}{d_{11}(s)} & \cdots & \frac{n_{1m}(s)}{d_{1m}(s)} \\ \vdots & \vdots & \vdots \\ \frac{n_{r1}(s)}{d_{r1}(s)} & \cdots & \frac{n_{rm}(s)}{d_{rm}(s)} \end{bmatrix}$$
$$= \begin{bmatrix} \tilde{n}_{11}(s) & \cdots & \tilde{n}_{1m}(s) \\ \vdots & \vdots \\ \tilde{n}_{r1}(s) & \cdots & \tilde{n}_{rm}(s) \end{bmatrix} \begin{bmatrix} d_1(s) & & \\ & \ddots & \\ & & d_m(s) \end{bmatrix}^{-1}$$
$$= \begin{bmatrix} \bar{d}_1(s) & & \\ & \ddots & \\ & & \bar{d}_r \end{bmatrix}^{-1} \begin{bmatrix} \bar{n}_{11}(s) & \cdots & \bar{n}_{1m}(s) \\ \vdots & \vdots \\ \bar{n}_{r1}(s) & \cdots & \bar{n}_{rm}(s) \end{bmatrix}_{\Xi} \xrightarrow{OQC} 3/20$$

The right decomposition can lead to a controllable realization and the left decomposition to an observable realization of

order = degree
$$[\det(D_R(s))]$$
 or
= degree $[\det(D_L(s))]$,

A state space realization can be easily obtained form the above as follows:

As seen, the above realization is controllable of order 6 which is equal to the degree of the determinant of $D_R(s)$.

Now let us observe the MFD B(s). It can be decomposed as:

$$B(s) = \begin{bmatrix} s^3 - s & 0 \\ 0 & s^3 - s \end{bmatrix}^{-1} \begin{bmatrix} s + s^2 & -s + s^2 & -1 + s^2 \\ -s + s^2 & -1 + s^2 & s + s^2 \end{bmatrix}$$

A state space realization may be

This realization is observable and of order is equal to the degree of the determinant of $D_L(s)$.

To get *minimality* we must extend the concept of *coprimeness* of scalar polynomials to polynomial matrices.

Hermite Forms and GCD's

We first need the concept of Hermite form of a polynomial matrix.

Row Hermite form = Upper Triangular form

$a_{11}(s)$	$a_{12}(s)$	•••		
0	a ₂₂ (s)	÷		÷
÷	·			÷
0		0	a _{rr} (s)	$a_{r,r+1}(s)$
:			0	0
:				÷
0		•••		0

with $a_{ii}(s)$ of degree higher than all others in i^{th} column.

Hermite Forms and GCD's (cont.)

The construction can be done by row elementary operations corresponding to multiplication with unimodular matrices on the left constructed from quotients and remainders using the Euclidean division algorithm.

Hermite Forms and GCD's (cont.)

Example (Reduction to Hermite Form)

$$\left[\begin{array}{cc} s^2 & 0 \\ 0 & s^2 \\ 1 & s+1 \end{array}\right] \longrightarrow \left[\begin{array}{cc} 1 & s+1 \\ 0 & s^2 \\ s^2 & 0 \end{array}\right] \longrightarrow \left[\begin{array}{cc} 1 & s+1 \\ 0 & s^2 \\ 0 & -s^2(s+1) \end{array}\right] \longrightarrow \left[\begin{array}{cc} 1 & s+1 \\ 0 & s^2 \\ 0 & 0 \end{array}\right]$$

The corresponding unimodular matrix is

$$\left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & s+1 & 1 \end{array} \right] \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -s^2 & 0 & 1 \end{array} \right] \left[\begin{array}{ccc} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{array} \right] = \left[\begin{array}{ccc} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & s+1 & s^2 \end{array} \right].$$

Construction of GCRD's

To construct a GCRD of N(s), D(s) we find a unimodular U(s) to carry out the row compression

< □ ▶ < □ ▶ < 三 ▶ < 三 ▶ 三 の < で 13/20

Then, R(s) is a GCRD.

Proof Let

$$\begin{bmatrix} U_{11}(s) & U_{12}(s) \\ U_{21}(s) & U_{22}(s) \end{bmatrix}^{-1} = \begin{bmatrix} V_{11}(s) & V_{12}(s) \\ V_{21}(s) & V_{22}(s) \end{bmatrix}$$

Then,
$$\begin{bmatrix} D(s) \\ N(s) \end{bmatrix} = \begin{bmatrix} V_{11}(s)R(s) \\ V_{21}(s)R(s) \end{bmatrix}$$

<□ ▶ < □ ▶ < ■ ▶ < ■ ▶ < ■ ▶ = つへで 14/20

and it is easy to see that R(s) is a common right divisor.

Consequently, we have the following matrix equation.

$$R(s) = U_{11}(s)D(s) + U_{12}(s)N(s).$$
(1)

<□ ▶ < □ ▶ < ■ ▶ < ■ ▶ < ■ ▶ ■ 9 Q ℃ 15/20

If $R_1(s)$ is another common right divisor, then

$$D(s) = D_1(s)R_1(s), \qquad N(s) = N_1(s)R_1(s)$$

and we have

$$R(s) = [U_{11}(s)D_1(s) + U_{12}(s)N_1(s)]R_1(s)$$

so that $R_1(s)$ is a right divisor of R(s) and so R(s) is a GCRD.

If $R_1(s)$, $R_2(s)$ are two GCRDs, then

 $R_1(s) = W_2(s)R_2(s), \qquad R_2(s) = W_1(s)R_1(s)$

 $R_1(s) = W_2(s)W_1(s)R_1(s).$

If $R_1(s)$ is nonsingular, then $R_2(s)$ is nonsingular and $R_1(s)$, $R_2(s)$ can only differ by a unimodular factor. If $R_1(s)$ is unimodular then $R_2(s)$ is also. If $\begin{bmatrix} D(s) \\ N(s) \end{bmatrix}$ has full column rank, all GCRD's are nonsingular.

Remark (Nonuniqueness of GCRDs: Summary)

Notice that by carrying out the elementary operations to reduce to Hermite form in difference orders we may get different matrices U(s) and hence different GCRDs. However, any two GCRDs, $R_1(s)$ and $R_2(s)$, say, must be related (by definition) as

 $R_1(s) = W_2(s)R_2(s), \qquad R_2(s) = W_1(s)R_1(s), \qquad W_i(s) \text{ polynomial}.$

Since

$$R_1(s) = W_2(s)W_1(s)R_1(s)$$

it follows that

1) If $R_1(s)$ is nonsingular, then the $W_i(s)$, i = 1, 2, must be unimodular, and hence the GCRD $R_2(s)$ is also nonsingular. That is, if one GCRD is nonsingular, then all GCRDs must be so, and they can only differ by a unimodular (left) factor. 2) If a gcrd is unimodular, then all gcrds must be unimodular.

Remark (Nonsingular GCRDs)

lf

$\left[\begin{array}{c} D(s)\\ N(s) \end{array}\right] \quad {\rm has \ full \ column \ rank},$

then all GCRDs of (N(s), D(s)) must be nonsingular and can differ only by unimodular (left) factors.
